

## Data Modelling 3-Act-Task Outline

Task and Focus Question	Important Mathematical Details
<p><b>How are the Covid-19 modelling projections created?</b></p> <p><b>Why do models from different sources show different projections?</b></p>	<p><i>Students will need a basic understanding of graphs.</i></p>
Lesson Outline	Notes
<p><b>Act One: The Question</b></p> <ul style="list-style-type: none"> <li>● Students will watch the <a href="#">video</a> or <a href="#">slideshow</a> of a text conversation between friends. At the end there are two discrepant graphs of Covid modelling predictions for the next few months.</li> <li>● Students will be asked what they notice or what they wonder about the situation that has been presented.</li> <li>● Discuss the students observations and questions as a group. Narrow and focus the question towards: “How do experts create Covid projections?” and “What are possible reasons for these graphs being different?”</li> </ul>	<p><i>Students should notice that the two graphs are the same until January.</i></p> <p><i>Students should notice the first graph projects a sharp increase in Covid cases while the second graph projects a slow decrease in Covid cases.</i></p> <p><i>Some possible student questions:</i></p> <p><i>Why are the graphs different?</i>  <i>What is the source of each graph?</i>  <i>Who made each graph?</i>  <i>How were the graphs made?</i>  <i>When were the graphs made?</i></p>
<p><b>Act Two: Gathering Information</b></p> <ul style="list-style-type: none"> <li>● Students will be split into smaller groups to consider the focus question. They will discuss what they know and what further information they will need to answer the question.</li> <li>● Students will ask for the information they feel they need to answer the question. They will be given links to Sources with answers to their questions.</li> <li>● Students will discuss the information provided and formulate an answer to the focus question that will be shared with the rest of the class.</li> </ul>	<p><i>Some possible student questions:</i></p> <p><b><i>What factors are considered when making projections?</i></b>  <a href="#">Public Health Agency of Canada</a>  <i>(Primarily Slides 9 - 14)</i></p> <p><i>The Institute for Health Metrics and Evaluation <a href="#">COVID-19</a> projections</i></p> <p><b><i>What factors cause the projected cases to increase or decrease?</i></b>  <i>BBC Explanation of the Reproductive Number <a href="#">Covid R rate: What is the R number and why does it matter?</a></i></p> <p><b><i>Which variables are considered most important?</i></b></p>

	<p><a href="#">COVID-19: Dr. Bonnie Henry presents latest coronavirus modelling for B.C.   Vancouver Sun</a> (From 10:16 - 14:10)</p> <p><b>What are the sources of the graphs?</b> <a href="#">Matthew's graph</a> (Public Health Agency of Canada - January 15th, 2021)</p> <p><a href="#">Steve's graph</a> (BC Centre for Disease Control - December 23, 2020)</p>
<p><b>Act Three: Connecting Models</b></p> <ul style="list-style-type: none"> <li>• Student groups will share their findings with the class and explain their reasoning.</li> <li>• After student groups have shared, hold a brief discussion of the connections between models, estimates, and real world situations</li> </ul>	<p><i>Students should have found the most significant factor in the projections is physical distancing and limiting contacts</i></p> <p><b>Possible explanations for the different models:</b></p> <p><i>Matthew's model was released later and would likely include the rise in Covid cases after Christmas. It may also have included the emergence of more infectious variants.</i></p> <p><b>Summary Discussion:</b> <i>Models and projections are based on the information available at a given time.</i></p> <p><i>Models and projections must be revised as new information becomes available, such as the emergence of variants that are more infectious or community outbreaks</i></p>
<p><b>Extension and Follow-Up</b></p> <ul style="list-style-type: none"> <li>• Call to action: Have students consider their role in lowering Covid transmission and brainstorm ideas to help their local communities.</li> <li>• For grades 11 and 12, have students explore what mathematical functions are involved in these models.</li> <li>• Have students create and share their own models and projections based on the data in your local community.</li> </ul>	<p><b>Possible Action Items:</b></p> <p><i>Write letters to the community leaders supporting measures that lower transmission.</i></p> <p><i>Asking experts in the community about local transmission and public health measures.</i></p> <p><i>Write letters to Dr. Henry asking for clearer links, data transparency, etc</i></p>
